

Ice dams do form on metal roofs.

The screw pattern is not bad. My guess is that there were too few screws and they were too short.

There is an assumption in the construction industry that metal roofs do not form ice dams. That is incorrect. They are less likely to form ice dams but can still form under certain conditions. Ice and water shield should be applied in the same manner as with shingle roofs.

Improperly secured metal roof
with no ice and water shield.
